Submission: ○ mood-recording-app

Assessed by: James Aitchison

Assessed on: Thu 6 Jan 2022

Positives

- App startup state
- Added README documentation
- Shared scale used across all bars
- Custom font used
- Common components split out and named well
- Static files split out
- Ran first time without errors
- Well structured code

Suggestions

- Unused imports
- Cropping issues on a smaller device. Bottom half of the "Submit" button is cropped for me
- Select placeholders aren't updating after I change their values, so I don't have visual confirmation that it's selected the value I pressed. It appears to be a visual issue, as I can tell it made the right selection when the data visualisation is updated
- Feels strange to see an empty bar with 0 values when I don't know what feeling it represents
- Common screen component
- "setTransformedData" and "transformedData" seem like convenential property names used in the components. "data" and "onEntry" / "onSubmit" would be more appropriate
- Bars aren't rounded like they are in the design

Conclusions

Orfeas has submitted a good assignment. They've demonstrated a good understanding of reusable components, well organised project with clean code. The build ran first time without errors, the documentation was easy to follow and static files were abstracted into their own module.

From a UI/UX perspective, there were some issues testing on an Android I was using. Part of the "Submit" button was cropped, and often didn't register presses. The placeholders weren't updating to show the value selected on the input screen, as well as empty bars showing without labelling which feeling they were associated with. Some of these points are subjective, and had this been a real piece of work, it would have been picked up in QA and dealt with quickly.
